No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the Isogenic strain y2; cn bw sp, the same strain used for the BDGP's pil and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library or filters for hybridization from the BACPAC Resource Center can be filters for hybridization from the BACPAC Resource Center can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genöscope.

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila melanogaster BAC library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector pBeloBAC11.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Submitted (23-JUL-1999) Genoscope - Centre National de Sequencage BP 191 91006 EVRY cedex - FRANCE (E-mail : seqref@genoscope.cns.fr

The BDGP is constructing a physical map of the Drosophia melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophia melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial ECORI digestion of Drosophia DNA provided by the BDGP from the isogenic strain y2; on bw sp., the same strain used for the BDGP's

Petermination of this BAC-end sequence was carried out as part of collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information plases see http://www.fiultfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo.

NY. The library is named RPCI-98 and was constructed by partial Ecost Indigestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp., the same strain used for the BDGP's pland EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Gosegawa and Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCT-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; on bw sp. the same strain used for the BDGP's pl and bow to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://Dacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a collaboration with the European Drosophila Genome Project (EDGP) - http://www.edgp.ebi.ac.uk - This Drosophila malanogaster BAC library (Droso BAC) was made by Alain Billaud at CEPH (Centre d'Etde du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Genevieve Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 271

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1257096-1258631, 1469064-1470983, and 1475592-1476743). Subtraction by Bento Soares and M. Fatima Bonaldo. " a

- Determination of this BAC-end sequence was carried out as part of collaboration with the European Drosophila Genome Project (EDGP) - http://www.adgp.ebi.ac.uk - This Drosophila melanogaster BAC | Library (Dros BAC) was made by Alain Billaud at CEPH (Centre d'Etude du Polymorphisme Humain) with funding provided by a MRC project grant. The DNA was prepared from embryos by Alain Bucheton and Geneviewe Payan. It has been constructed in the vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Arabidopsis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium quitamicum. These are useful for identifying the mutation point of a gene derived from a mutant _{\bf c} foryneform bacterium, measuring expression amount and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene
                                                           are provided (see AAM72849-57) of the uridine-binding motifs of the dUTPBASES and dCTP deaminases of Pyrococcus furiosus (see also AAM72847), wetherebrichia coli, yeast, human and herpesvirus; a consensus (see AAM72847), wethenococcus jannaschii, Desulfurolobus ambivalens, Escherichia coli, yeast, human and herpesvirus; a consensus (see AAM72848) is also provided. A claimed method of enhancing a nucleic acid polymerase reaction comprises performing the reaction in the presence of one or more of the following: a polymerase enhancing factor (PEF), a dUTPBASE, a protein that turns-over dUTP and a protein having one or more of the sequences provided in AAM72848-57. Rits are provided for replicating sequences given in AAM72848-57. Kits are provided for replicating sequencing or for site-directed mutagenesis, for nucleic acid sequencing or for amplification (preferably PCR or RT-PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Yokoi H;

analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from Coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes polynucleotides, such as complete cDNA sequences and/or sequences of genomic DNA encompassing complete genes, portions of genes, and/or intergenic regions, collectively referred to as sequence-determined DNA fragments (SDFs), from corn plants and Arabidopsis thaliana. The SDFs are promoters, structural genes, untranslated regions (UTRs), or 3' termination sequences. They can used for expressing a gene product and controlling expression of a target gene, either as a promoter, a structural gene, an UTR or as a 3' termination sequence. They are also useful as tools for genetic mapping, and identification of a particular individual plant or for clustering a group p plants with a common trait. AAA78433 to AAA78630 and AAB24605 to AAB25099 represent the specifically claimed polynucleotide sequences and polypeptides encoded by them given in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Plant; corn; Arabidopsis thaliana; sequence-determined DNA fragment;

The invention provides a functional site descriptor (FSD) that defines a spatial configuration of a functional site (other than a divalent metal ion binding site) in a protein (1), for use in an inexact threedimensional (3D) structure model of (1) to determine if (1) possesses for at least one atom in each of at least two amino acid (aa) residues that comprise the functional site of (1) and at least one as is identified as a particular as (or set of aa). The atoms are: (i) amide nitrogen, alpha or carbonyl carbon, or carbonyl oxygen within the polymer backbone; (ii) a beta-carbon of aa, or (iii) a pseudoatom, with at least one being of type (i). FSD are used to predict biological activities of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        proteins, e.g. enzymatic, ligend-binding protein interaction activities, of animal, plant, prokaryotic or viral origin. They may also be used to validate/confirm results from other predictive methods. The method can be used even with inexact (computed) models of protein structure, deduced from protein or nucleic acid sequence data, i.e. an accurate 3D model of the whole protein is not required, rather just the 3D orientation of the active site. Sequences AAY77991-Y78000 and AAY77923-924 represent peptides used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                             Functional site descriptor for proteins, useful for predicting protein arrivity.
                                                                               Functional site descriptor; FSD; enzyme; protein structure; three-dimnsional structure; active site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DB 21;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The alpha-sarcine coding sequence was isolated from a cDNA expression library following screening with an antibody. The amino acid sequence was deduced from the cDNA sequence.

This invention describes a novel functional site descriptor (FSD) that defines a spatial configuration for a functional site of a protein.

The functional site corresponds to a biological function other than a divalent metal ion binding site. The FSD is applied to an inexact.

The functional site defined by the FSD is applied to an inexact. The protein possesses the biological function corresponding to the constraints for one or more atoms in each of 2 or more amino acid functional site defined by the FSD. The FSD comprises a set of geometric constraints for one or more atoms in each of 2 or more amino acid residues comprising a functional site of a protein other than a divalent constraints for one or more atoms in each of 2 or more amino acid residues, where at least one of the 2 or more amino acid acid residues, where at least one of the atoms is an amide nitrogen, alpha-carbon, carbonyl carbon, or carbonyl expen, within a polypeptide calpha-carbon, carbon, carbon, carbonyl expen, within a polypeptide backbone. The remaining atoms maybe any of the atom as above or beta-carbons of amino acid residues, or pseudoatoms. The FSDs can be used to identify or screen for a novel function in one or more consection, or to provide further information of a protein. The methods confirm a previously identified or suspectific functional confirms a previously identified or suspectific functional site in a protein. Using the methods it is not necessary to accurately confedict its function. Instead, prediction of biological function of a predict its function of the protein under investigation. Afficial function using concerning used to describe in a region responsible for the particular or the particular or function of the protein under investigation. Afficial function in the method of the protein under investigation. Afficial function in the protein under investigation. Afficial function in the protein under investigation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                      Novel functional site descriptors, used for identifying a protein as having a particular biological function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

```
modifying a plants environmental stress. The transcription factor is encoded by environmental stress. The transcription factor is encoded by environmental stress tolerance gene derived from Arabidopsis thaliana. The transcription factors and the genes encoding them are used to alter the structure and developmental characteristics of plants such as soybean, wheat, corn, potato, cotton, rice, oilseed rape, sunflower, alfalfa, sugarcane, turf, banana, blackberry, papaya, strawberry, raspberry, cantaloupe, carrot, cauliflower, coffee, onion, cucumber, eggplant, grapes, honey dew, lettuce, mango, melon, blueberry, peas, peppers, pineapple, spinach, squash, sweet corn, tobacco, tomato, watermelon, rosaceous fruits and/or vegetable brassicas. These sequences are also used for modifying traits associated with environmental stress tolerance, such as freezing, chilling, heat, drought, water saturation, sailt, photoconditions, radiation and ozone. The transcription factors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                          The present amino acid sequence is Arabidopsis thaliana transcription factor homologue. This novel transcription factor is useful for modifying a plant's phenotype in desirable ways, such as
                                                                                                                                                                                                                                                                                                                    .;
